Diagnosis, Differentiation and Management of Different Types of BPPV

Joanne Sebastiana M. De Ramos

St. Luke's Medical Center-QC | Philippines

Benign Paroxysmal Positional Vertigo (BPPV) is a peripheral vestibular disorder and the most commonly diagnosed type of vertigo in both primary care and subspecialty settings. It is defined as a disorder of the inner ear characterized by repeated episodes of positional vertigo. The session is intended for clinicians who diagnose and manage BPPV. It aims to present an approach to BPPV, emphasizing on the differentiation of the various types of BPPV based on its clinical presentation. Subsequently, with a more efficient establishment of the diagnosis, application of the appropriate management for each type of BPPV may be performed.
