Non-surgical Rhinoplasty using Filler and Thread: Indications and Guidelines for Safe Injection

Henry John F. Claravall

University of Santo Tomas Hospital | Philippines

Rhinoplasty is a medical procedure used to modify the physical appearance of the nose. It is the most common aesthetic procedure that can be done either surgically or non-surgically using injectables. I believe that surgery is still the gold standard in terms of longevity, ability to alter anatomy and the possibility of simultaneous correction of nasal function. However, recovery from surgery may take around 7 to 14 days depending on the health status of the patient. Surgery is also not recommended for uncontrolled co morbid conditions such as hypertension and diabetes. These are the reasons why the demand for non-surgical rhinoplasty is constantly increasing. Patients prefer shorter downtime with minimal risk. As of the moment, non-surgical rhinoplasty can be accomplished using fillers and threads. The aim of the lecture is to enumerate indications of non-surgical rhinoplasty and to present guidelines for safe injection
